TRADINGBIBLE HOLDINGS, INC.

TBC Whitepaper & Utility Roadmap

Issuer overview · functional design · delivery milestones

TRADINGBIBLE.APP • DELAWARE, UNITED STATES • OCTOBER 2026

Issuer: TradingBible Holdings, Inc., a Delaware corporation. Sole stockholder and director: Name withheld from the public reading copy (ownership represented by management; confirm against signed company records). Proposed asset: TradingBible Coin (TBC). Planned maximum supply: 100,000,000 TBC.

1. Executive description

TradingBible Coin (TBC) is a proposed digital asset intended for integration with the TradingBible technology ecosystem. The issuer is evaluating a deployment on Base followed, if feasible and lawfully implemented, by an independent blockchain provisionally known as TradingBible Chain.

This briefing describes a development proposal, not a representation that token functionality, public distribution, blockchain migration, staking or governance is currently operational. A feature is designated live only when the issuer can provide production records, tested interfaces, operating controls and evidence of lawful availability.

2. Issuer and ecosystem context

TradingBible intends to develop charting, trading analysis, order-flow visualization, heatmaps, account synchronization, trading education and related software services. Any functionality provided by a regulated broker, custodian or payment business must be distinguished from software supplied by TradingBible.

The token’s issuance and any potential brokerage business are separate legal and operational workstreams. Ownership of TBC does not by itself confer an equity interest in TradingBible Holdings, Inc., a right to profits, a trading account, brokerage authorization, or guaranteed access to future products.

3. Proposed utility matrix

Proposed use	Launch status	Prerequisite
Eligible ecosystem service payments	Planned; not verified live	Product pricing, checkout, accounting and legal assessment
Developer/API access and network services	Planned	Published service terms and metering
Staking or network participation	Future proposal	Security/economic design and jurisdiction analysis
Governance participation	Future proposal	Defined voting scope and anti-abuse controls
Transaction fees on TradingBible Chain	Future proposal	Independent chain deployment and validator operation
Partner integrations	Potential future use	Executed partner agreements and supported APIs

4. Development sequence

Phase A — Design and legal assessment: confirm economic model, token rights, sale structure, customer eligibility and engineering requirements. No public token sale is authorized merely by completion of this phase.

Phase B — Prototype and private testing: implement a controlled token prototype, test issuance permissions, custody, transfer restrictions where needed, monitoring and reconciliation.

Phase C — Independent assurance: obtain security review of contracts, distribution workflows, privileged roles, bridge design and incident response; remediate material findings.

Phase D — Limited permitted release: enable only those jurisdictions, customer categories and features approved for launch by counsel and operations management.

Phase E — TradingBible Chain research and testnet: assess Cosmos SDK/CometBFT/Cosmos EVM architecture, network governance, validators, fees and interoperability. A chain launch is contingent, not promised.

5. Supply integrity and migration

The proposed maximum economic supply is 100,000,000 TBC. Any later migration must maintain one-for-one economic accounting: tokens locked or retired on the source network must correspond to tokens issued or released on the destination network, with reconciled balances and independent audit evidence. No routine discretionary minting is contemplated.

6. Purchaser communications and risk

No statement should imply guaranteed exchange listing, liquidity, appreciation, dividends, redemption, staking yield or future delivery date. Project timelines may change or be cancelled. Buyers may lose all amounts paid, and smart-contract, custody, operational, legal and market risks are material.

Decision and evidence register

The following matters require written confirmation before the relevant terms are adopted or represented as operational. Attach the cited evidence to the controlled project record.

Decision / evidence item	Responsible party	Record or outcome
Utility demonstrably available at first sale	Product and engineering	_____
Chain architecture and bridge specification	CTO / security	_____
Rights granted to TBC holders	Management and legal	_____
Roadmap dates and release criteria	Management	_____
Whitepaper claims and supporting evidence	Counsel and compliance	_____

Review and acknowledgment

This page records receipt, review, or internal approval in the capacity identified below. A reviewer's acknowledgment does not itself constitute a regulatory approval or formal legal opinion.
